

BUG REPORT : TEST REPORT

VARAD KULKARNI
MT24AAC007

- 1) A continuous leak in the background service rapidly consumes all available RAM, resulting in an OOM error.
- 2) When rendering the main dashboard in the Android 4.1 Jelly Bean Web View wrapper, the CSS sticky navigation bar loses its z-index stacking context if the user scrolls past a hardware-accelerated HTML5 video element. The video element bleeds through the navigation menu layer, rendering the overlapping dropdown links completely unclickable, but this anomaly only occurs when the device is rotated into landscape orientation
- 3) Uploading a large file triggers a fatal exception, causing the app to completely crash and close.
- 4) When clicking the 'Generate Report' button, the application completely locks up. The user interface becomes totally unresponsive to any mouse clicks or keyboard input, and the loading spinner gets stuck endlessly on the screen
- 5) The navigation menu and buttons appear perfectly fine on the screen, but they are completely unresponsive because the main thread is locked up in an infinite loop
- 6) The UI elements stopped rendering and the screen went blank because the WebGL context crashed after exceeding the 2GB VRAM limit.
- 7) When adding three items to the shopping cart, the final checkout price calculates the tax incorrectly, resulting in a total sum that is five dollars lower than it should be
- 8) After updating my user profile with a new email address and clicking save, navigating away and coming back shows the old email address again. The updated data is not saving to the database.
- 9) All available system memory is being rapidly exhausted by a continuous leak in the background service, leading to a fatal OOM failure.
- 10) Upon startup, the application attempts to read a corrupted DWORD value from the Windows Registry under HKEY_LOCAL_MACHINE. Failing to gracefully handle this missing configuration, the core background process throws an unhandled exception and immediately crashes to the desktop
- 11) When toggling dark mode on the iPad Pro in split-view, the main text area background remains white while the font correctly turns white. This state mismatch renders all document content completely invisible to the user until the app is forcefully restarted
- 12) During the bulk data export, the main execution thread completely deadlocks. The client process stops communicating with the server, hangs indefinitely at 99%, and completely locks up, requiring a hard process kill to recover.
